

# Module 5 – (ch13) Investor Behavior and Capital Market Efficiency

Henrique C. Martins - henrique.martins@fgv.br

Note: This summary will be delivered in printed form only. No PDF version is available.

Overview: This summary covers the key points from Ch. 13 of Berk & DeMarzo.

#### 1) Competition & Alphas

Prices continuously incorporate news; investors compare expected vs. required return (SML)  $\Box$  alpha = gap. Competition tends to drive alphas toward zero.

## 2) Information & Rational Expectations

Market efficiency requires correct interpretation of info on average. Market can look inefficient if many investors misread signals or care about non-mean/variance goals.

## 3) Individual Investor Biases

Underdiversification (familiarity, relative wealth), overtrading (overconfidence, sensation seeking) → lower net performance after costs.

#### 4) Systematic Trading Biases

Disposition effect (sell winners, hold losers), attention/mood effects, herding. These can create temporary predictability exploited by sophisticated traders.

## 5) Efficiency of the Market Portfolio

After fees, average mutual fund *net* alpha  $\leq 0$ ; scale/liquidity constraints erode skill advantages. Holding the market is hard to beat persistently.

#### 6) Style-Based Patterns

Size, value (HML), and momentum signals have earned positive historical alphas; may proxy for risks or behavioral mispricing.

# 7) Multifactor Models

Beyond CAPM: APT and Fama-French-Carhart (MKT, SMB, HML, MOM). Expected return as exposures to multiple traded factor portfolios.

#### 8) Methods in Practice

Managers largely use CAPM/WACC, sometimes with factor overlays; evidence and behavior still broadly consistent with CAPM discipline.
